

LinkedIn Data Scraping

Considering that this is my personal project and personal interest, it wouldn't be considered illegal per se. Applications must be authorized and authenticated before they can fetch data from LinkedIn or get access to member data.

The following permissions are available to all developers, and can be added via the self-service through the LinkedIn Developer Portal.

Product/Program	Permission	Description
Sign in with LinkedIn using OpenID Connect	profile	Member Auth: Retrieve authenticated member's name, headline, and photo.
Sign in with LinkedIn using OpenID Connect	email	Member Auth: Retrieve authenticated member's primary email address.
Share on LinkedIn	w_member_social	Member Auth: Post, comment and like posts on behalf of an authenticated member.

That means I could ask Prof. Dr. Monett Díaz to grant me access to her profile in her Developer Portal. That I will not do, as I am currently still awaiting a grade from her.

She's also rather (very much) Anti-AI so I don't think she'd approve of the letting-an-agent-asses-her thing.

You can also request API Access page within the LinkedIn Learning API space, but it is available to members of the LinkedIn Partner Program and organizations that have purchased LinkedIn Learning site licenses, neither of which includes me.

I also watched a video titled "[How I Get UNLIMITED Data From LinkedIn In SECONDS](#)". They advertise using ScrapeTable for collecting data, but it appears, that only personal account information is collected. So, it's helpful tool when looking to collect many people's information through their LinkedIn profile, but nothing about their actual posts.

While it appears to be *possible*, to automate data collection from LinkedIn, the initial effort would even outshine logging nine LinkedIn posts daily. I am also not interested in getting banned, which is why I didn't watch more Youtube Tutorials (maybe that will change in the future).
